extensive and in-depth analysis in this field, the primary idea of this empirical study was to offer a possible methodological solution for assessing users’ perceptions of WELS. This might be used as an inspiration for developing novel (similar) evaluation models, with an ultimate goal of getting a clearer overview of what should be improved in the existing systems of this type in the future.

Acknowledgements: The authors would like to thank colleagues and students from “Mediterranean” University (Montenegro), as their kindness made the successful implementation of the survey and analysis of the obtained results possible, which can be used as a stimulus for further research in this area.
