students who had chosen the profession unwillingly. These results make us think that interiorizing the nursing profession is very important in terms of increasing care-giving responsibility that is sensitive to cultural needs.

5. Conclusion and Recommendations

The study determined that nursing students have a high level of intercultural sensitivity. In the study, it was identified that nursing students' intercultural sensitivity is affected by factors such as their year of study, income level, knowledge of a foreign language, and having chosen the nursing profession willingly. It is thought that intercultural concepts, theories and maintenance strategies should be integrated into the curriculum of nursing education in order to increase nursing students' intercultural sensitivity. It is recommended that the intercultural sensitivity education programs be implemented in postgraduate in-service training programs.

Acknowledgements

The study was not funded by any institution. We wish to thank all the nursing students who so willingly participated in this study.

Conflict of interest

The authors declare that they have no conflict of interests. The authors take full responsibility for the content of the article.
